Made in Oregon
hewn.com

HEWN

Hewn is a leading manufacturer of fine architectural products and finishes, specializing in proprietary and custom offerings produced with our expert in-house manufacturing processes and unsurpassed finishing capabilities.

Our sales team works directly with architects, builders, and designers to understand the full scope and material needs of your project. In addition to our standard options, Hewn's highly-skilled team of color and finish specialists are able to craft custom color and textural finishes, which allow designers and architects to fully realize their project's potential.

Hewn's Oregon-based facility features 40,000 ft² of milling, fabrication, and finishing, with an in-house team capable of tackling any challenge. Having our entire production process under one roof helps us simplify your project through expert value engineering and total oversight of the production workflow. No matter the size or complexity of your project, we invite you to discover how Hewn can make your vision a reality.

THE DEFINITION OF “HEWN”

Hewn (hyün): The result of hewing.

It is the art of making beams from trees for all sorts of structures, from bridges to ships to barns. The process begins with the right diameter trees which were felled and hewed into a square or rectangular shape and seasoned for about a year before used for construction.

The process of hewing was often done with a felling axe which is the most common shape in today's axes and a broad axe, a longer blade which sometimes had a few degree angle to it for side cutting. In some cases an adz would have been used for a cleaner more desirable looking beam. An Adz is an axe with a perpendicular blade which worked like a swinging hand planer.

Before hewing would begin the trees would be selected for size, strength and sometimes species depending on what the beams would be used for. It is not uncommon to see a mix of

pine, chestnut, oak and any other species that would have been growing in close proximity to an old barn.

The trees would be fallen and hewed green. Green wood is much softer and more flexible than dry seasoned wood. Once the wood is hewed into a beam it would be stickered and stacked for a year of seasoning. During this process of drying the wood shrinks and becomes harder. The timbers were often very strong and stable because they were cut around the center of the tree.

This process of making beams by hand ended with the introduction of the saw mill. It's really something to appreciate when you see hand hewn beams in a building today.

Our hand hewn beam texture is done by hand in our Oregon workshop to replicate the hand cut look of an old hewn timber. There is not a machine available that can replicate true hand hewing. Every axe stroke is a deliberate cut in the wood and although it's a repetitive cut it's perfectly uneven!

Cedar Ceilings · Farm Fleet

BOX BEAMS

All of the charm of a solid timber beam, at a fraction of the cost and weight.

Hewn has grown to become the largest manufacturers of wooden box beams in North America.

As a vertically-integrated workshop, Hewn is able to take the wood from start-to-finish through the milling, color, texture, and beam assembly processes, before shipping directly from our Oregon workshop to your job-site or home.

All of our beams are made from real wood, sustainably sourced from North American forests, free of contaminants that often plague real reclaimed wood

products. Our beams can be created in large quantities with consistent color and texture, while retaining the natural variance and authentic charm and texture of a real-wood product.

Though the end-result can often appear as if the beams are tightly woven into the fabric of the structure, all of our beams are non-structural, and can be installed using simple sleepers attached to studs. This results in a quick and easy installation, allowing for schedule flexibility and greater efficiency on the job-site.

CEDAR BOX BEAMS

One piece Cedar box beams are available in lengths from 4' to 15'6". For lengths longer than 15'6", you can choose one of our joint options. All of our box beams are completely customizable to the specifications of your project, including color, texture, size, length, and number of sides.

HEWN

EASY BEAM INSTALL

Hewn beams are lightweight, easy-to-install, and can quickly add character and value to any space.

The first step to hang our beams is to install a sleeper. A "sleeper" **(1)** is a piece of wood that attaches to the ceiling, creating a surface for the beam to attach to.

Cut sleepers to fit the inside diameter of the beams you will be installing. Beams should be able to go on easily and fit snugly. Using a stud finder, mark the location of the studs on the ceiling. For an easier install, pre-drill sleepers with the spacing of the studs. Drill the holes to fit 3" heavy-duty drywall screws, making holes slightly oversized to ensure that you bite into the stud.

Align the pre-drilled holes to your stud markings, and attach with 3" heavy-duty drywall screws **(2)**.

Measure your beams to match the dimensions of your ceiling **(3)**. Score the beams with a straight edge **(4)**, and cut beams to length, making sure all ends have a clean square cut **(5)**. Consider where your joints will be in your layout.

Holding a 15 gauge finish nailer close to the ceiling, nail through the side of the beam and into the sleeper every 12". Repeat on other side of beam **(6)**.

With a little prep work and the right measurements, an entire ceiling's worth of beams can be installed and ready-to-go in one afternoon!

NORTHWESTERN SPRUCE BOX BEAMS

SHIPWRECK

**The latest addition to our Hewn texture line-up,
unlike anything else on the market.**

Our woodworkers and skilled artists here at Hewn constantly push the limits of what is possible to create out of new, sustainably sourced wood material. Our latest textural product offering, Shipwreck, continues this legacy by combining our fine attention to detail with our unmatched ability to craft exquisite lightweight box beams that look like solid timbers from any distance.

Shipwreck is the most textured finish option that we have ever offered. This texture combines the cracks and nail holes of

our Distressed texture option, with a heavy Hand Hewn look that goes beyond what we have previously offered on any wood species. The depth of this texture is unmatched as well, featuring not just notch marks, but actual dimensional variance on the outside surface of the wood.

Our inspiration for Shipwreck comes from the finely crafted wood sailing vessels of yesteryear, many of which have met their demise in the deep depths on bottom of the ocean.

While salvage operations may be out of reach, Shipwreck allows you to tap into this seafaring legacy for your own home or commercial space. Whether your design is nautical in nature, or modern with a hint of rustic charm, our Shipwreck box beams can be incorporated into your space with ease, and fully customized to fit your needs.

Contact us today to learn more about Shipwreck, order material samples, and to begin your individualized design and ordering process.

CUSTOM PLYWOOD BOX BEAMS

Hewn's Custom Plywood Box Beams are offered as part of our extensive finishing capabilities, and feature a wide range of options and finishes. Plywood Beams can be made in a wider range of wood species, and nearly unlimited finish options. Standard beam can be made without a joint at lengths up to 7'10", with

widths and heights ranging from 1.5" up to 47" per side. Pre-assembled beams with joints are available up to 40'.

We also offer pre-manufactured cloud systems, as well as radius and arch beams, all of which are made possible by the unique properties of plywood.

WALL PANELING & SIDING

All of the character of reclaimed wood, without any of the damaging compromises.

Hewn has its roots in a passion for reclaimed barnwood, and the story that it tells of American history and culture.

Unbeknownst to many, the reclaimed barnwood industry is not always a positive portrait of recycling and sustainability, as it is often portrayed.

In many instances, historical buildings with cultural value to local communities are torn down for their aged barnwood, which has risen in value as the demand for reclaimed wood has increased. In addition, many of these buildings are located in environments with regular

exposure to contaminants that are unsafe for living spaces.

While some companies go to great lengths to treat and refinish their reclaimed wood to make it safe for consumers, wood is often sold as-is to unsuspecting buyers.

In response to this, Hewn developed a way to reproduce the aging process in a workshop environment, starting with mill-direct sustainably sourced lumber, and applying our proprietary non-toxic aging, distressing, and coloring process to create a new and wholly unique product.

CEDAR WALL PANELING

Our Interior Cedar Collection is created using mill-direct Western Red Cedar and a proprietary non-toxic wood treatment process, resulting in a reactive finish designed to mimic actual reclaimed barnwood. It is sold in solid 13/16" boards

with multiple milling and width options available, and custom thicknesses available upon request. In addition to our catalog colors, we can also match and formulate custom colors to meet the individual needs of our clients.

THE OHANA COLLECTION

The Ohana Collection is inspired by the sights and color palettes of Hawaii. These bold and invigorating colors are designed to be complementary to each other, and our other product lines, making them an ideal option for an accent piece, or as

your primary color choice. All of our Ohana Collection options feature a charred raised wood grain and a variety of color tones, adding depth and texture that cannot be created with a standard paint application.

YAKISUGI SHOU SUGI BAN

Reinventing a traditional Japanese art to give wood strength, character, and perseverance.

Yakisugi (also known as Shou Sugi Ban) is the Japanese art of charring wood to create a blackened, dark finish with unique properties and characteristics. When traditionally applied, the Yakisugi/Shou Sugi Ban process creates a layer of carbonization on the wood which offers a degree of natural resistance against water, fire, rot, and insects. This blackened surface ages with the elements, creating a stunning patina.

When applied for aesthetic purposes, the charring process creates unique shapes, textures, and tones that cannot be replicated through paint or stain. Products featuring an

aesthetic application still gain the natural benefits of this carbonized layer, but can be supplemented with additional finishing and sealers to create a product that is less delicate to the touch.

We offer a number of Yakisugi wood treatments, with varying levels of char and color characteristics. We also offer sealed Yakisugi, creating a more durable product for transport and protection against the elements on exterior surfaces. For extremely sensitive environments where exposed carbonization would be problematic, we offer Dāku Ban, an imitation Yakisugi with no burn whatsoever.

Inferno

Rich black burn with striking red in the cracks

Sub Zero

Rich black burn with a stunning blue in the cracks

Our preferred woods for applying a Yakisugi/Shou Sugi Ban technique are Accoya® and Kebony. This is due to the incredible durability of these woods, both on the surface and throughout the core of the board, allowing for a carbonization that is overall more stable and durable than on other species.

These Accoya® and Kebony offerings include traditional unsealed finishes for exterior use, sealed finishes for interior use (to prevent transfer of carbon upon touch), and experimental finishes involving color and texture.

Our Western Red Cedar and Northwestern Spruce Yakisugi/Shou Sugi Ban catalog offerings generally feature a lighter burn, and a charring pattern that retains the natural texture of the wood. This creates a deep protective finish, without any additional coloring.

Alternately, our Dāku Ban options are specially designed to mimic the rich black finish of Yakisugi/Shou Sugi Ban without any charring whatsoever, for sensitive environments and installations. As always, custom colors, textures, and finishes are available upon request.

ACCOYA®

Unprecedented durability meets Hewn's unique and lasting finishes and custom milling capabilities.

As the first company to produce acetylated wood on a commercial scale, Accoya® is leading the charge in providing durable and dimensionally stable wood for a variety of applications.

In the acetylation process, softwood is effectively turned into a hardwood through the introduction of a non-toxic vinegar-like solution, creating a new type of wood that is durable all the way through the board, not just on the surface. In practice, this allows for a wood product

that is significantly protected against the elements, making it perfect for installation in environments where a standard sealed wood product would fail after only a short amount of time.

At Hewn, we take Accoya® wood, and apply our proprietary finish techniques to create beautiful, unique, and long-lasting wood products, customizable for any project.

KEBONY

Hewn's Kebony Collection is an excellent choice for residential and commercial siding applications. Using Kebony Clear Cladding as a base, our product is designed to be an ethical alternative to tropical hardwood siding.

Kebony produces all of their products from FSC®-certified woods, aiming to have a substantially lower carbon

footprint than their tropical hardwood counterparts. Kebony's non-toxic proprietary process also darkens the wood, replicating the look of tropical hardwood throughout the entire board.

Hewn's Kebony Collection is sold with multiple milling profile options, and can be customized to fit the needs of your specific project.

WHITE OAK FLOORING

Resurrecting classic solid oak flooring and wide-plank options for modern spaces.

Hewn is one of the few American companies with a nationwide presence producing timeless solid White Oak flooring crafted with traditional methods. We start with 1" solid rustic white oak, and utilize the natural surface of the wood as our platform to create the timeless look and tone of an antique board.

With the ability to mix board widths up to 9" (wider widths available based on market conditions) in a variety of lengths from 5' to 10', our hardwood flooring product can achieve any vision you have in mind.

This flooring material is sourced from the Northern Midwest region of the United States.

These boards are cut, seasoned, and dried before being shipped directly to our shop. All of our flooring is hand-tooled, and delivered with factory finished edges.

Our products can be delivered within predictable deadlines, and are free of any dangerous contaminants that are often found in reclaimed wood products or cheaper hardwood flooring from non-domestic sources.

While we use many modern techniques to create our hardwood flooring products, each piece of wood is unique, and has its own distinct character that is often missing from mass-produced flooring.

HEWN

The skilled team at our Oregon workshop has the capability to create matching trim, vents, treads, and accessory pieces, so that every part of your floor matches.

In addition to our solid oak options, we also offer engineered flooring upon request.

Rustic White Oak Stair Treads

CUSTOM COMMERCIAL AND RESIDENTIAL

You dream it, we build it.

Our Oregon facility features 40,000 ft² of milling, fabrication, and finishing, with an in-house team capable of tackling any challenge.

Our sales and production teams work one-on-one with every client to ensure that each project receives personalized attention. We focus on value engineering the product to meet our clients' specific goals, staying on-time and within budget.

Communication is key in any project, and we strive to make sure our clients' needs are met throughout the manufacturing process. Our complete production oversight allows us to produce custom samples, maintain an approval process,

catalog every finish, and provide shop drawings individually tailored to every project. We are not limited by size, shape, or complexity. With combined decades of finishing experience, our team can do it all.

Custom wood ceiling assembly
Seattle-Tacoma International Airport, Washington

Custom curved wood ceiling accents (left), to accommodate a chimney (above)

HEWN

Many of our custom offerings are designed to be easy-to-install once on site. Our Radius Beams are CNC-cut and hand-assembled for the best possible quality. Engineering is available for larger assemblies, and shop drawings are always provided prior to final approval.

Hewn is also capable of crafting complex shapes and assemblies, replacing work that would

previously have required on-site woodworking. And because we ship nationwide (and to some international destinations), job site location is never an issue.

Whether your desired look is rustic, modern, or something in-between, Hewn can truly do it all.

White Oak Plywood Ceiling Cloud Assembly
Dallas, Texas Showroom

SUSTAINABILITY

The recent increase in demand for reclaimed wood materials has taken a toll on the supply chain for re-purposed wood. What was once seen as a way of recycling materials from existing structures has become a damaging practice in which buildings with history and purpose are being torn down for their material value.

We believe the best way to honor the past is to preserve it. The wood we use is a sustainable resource, sourced locally from North American forests and specifically planted to be harvested via responsible means.

When practiced properly, responsible forestry techniques represent one of the greatest tools in the fight to preserve our old-growth forests on a grand scale, and protect the fragile ecosystems that call them home.
